

Care Connect

Complete User Manual — Agents, Supervisors and Administrators

Version 3.0 - August 2026 • <https://elcareconnect.lovable.app>

1. Introduction

Care Connect is an AI-assisted customer engagement platform for insurance and care teams. It combines automated voice campaigns, live agent calling in the browser, real-time supervision, multilingual IVR, appointment booking and analytics in a single workspace.

This manual covers everything a non-technical user needs: signing in, navigating the workspace, running campaigns, managing clients and agents, handling live calls, scheduling appointments, reviewing analytics and handling privacy requests.

2. Getting started

2.1 Accessing the platform

Open <https://elcareconnect.lovable.app> in Chrome, Edge or Safari. The app is responsive and also works on tablets. Microphone permission is required for browser calling and voice-to-text.

2.2 Signing in

Enter the email and password from your invitation email, or use your organisation's single sign-on if Active Directory has been connected. New agents receive a one-time link that opens a password-setup screen; the same screen is used for password resets. If you see "Invalid login credentials", check the email address first, then ask an administrator to re-issue the invitation.

2.3 First-run checklist for administrators

- Setup → Telephony: set the default caller ID, bridge phone and carrier credentials, then run Verify.
- Setup → People: invite your supervisors and agents, and assign roles.
- Setup → Catalog: create the Product Types and Campaign Types your team sells.
- Setup → Voice & Languages: upload recordings and build the IVR menu.
- Dashboard → Clients: import your client list and tag it.
- Dashboard → Campaigns: create your first campaign and enqueue a small test run.
- Publish the app for production use.

3. Workspace tour

A collapsible left sidebar handles navigation; the top header holds the search palette, theme toggle and your status widget. Items you do not have access to are hidden.

Section	Audience	Purpose
Dashboard	All signed-in users	Analytics, Campaigns, Calls, Appointments and Clients tabs.
Supervisor	Supervisors and admins	Live queue, agent states, escalations.

Section	Audience	Purpose
Campaign Analytics	Admins	Per-campaign results with client drill-down.
Setup	Admins	People, voice, telephony, catalogue and secrets.
Miscellaneous	Admins	Notes, transcripts, transfers, callbacks, leaderboard, knowledge base.
Profile	All	Display name, avatar, password and privacy requests.
Documentation	All	This guide, in-app and searchable.

4. Roles and permissions

Roles are enforced by the database, not by the menus. Hiding a menu never grants or removes access.

Role	Can do
user	Dashboard, call tools, profile and documentation.
agent	As user, plus presence, skills and routed call handling.
supervisor	Adds the supervisor console for live floor monitoring.
admin	Adds Setup, admin tools in Miscellaneous, and Campaign Analytics.
super_admin	Adds Active Directory SSO, SIP trunks and app secrets.

5. Clients

Dashboard → Clients holds the client master list. Add records individually, or use Import CSV for bulk loads and map the columns before saving.

- Phone numbers are normalised to international E.164 format automatically, so a local number such as 0246052499 is stored as +233246052499.
- Numbers that cannot be normalised are rejected with a clear message rather than a database error.
- Tag clients so campaigns can target a segment instead of a hand-picked list.

6. Campaigns

6.1 Campaign types

Setup → Catalog → Campaign Types defines the reusable templates (for example Premium Reminder or Payment Follow-up), including the prompt, default IVR menu, retry policy and language defaults.

6.2 Creating a campaign

- 1 Dashboard → Campaigns → New campaign; choose a campaign type, name and tags.
- 2 Clients tab: use Add one for a single contact, or attach a tagged segment. Product Type is a dropdown fed by Setup → Catalog → Product Types, and the due date uses a date picker so every record is stored in the same format.
- 3 Recordings tab: pick the intro recording and any language-specific audio.

- 4 Translations tab: supply localised prompt text per supported language.
- 5 Set the dialing window, maximum concurrent calls and retry attempts, then enqueue.

6.3 Monitoring a run

The progress panel shows dialed, connected, answered, voicemail, failed and pending counts in real time. Administrators can pause, resume, cancel or retry failed calls, and every control action is written to the audit log. Calls that stall are reconciled automatically against the telephony provider.

6.4 Recordings and transcripts

Recordings appear within seconds of call completion. Transcripts are generated automatically and are searchable; a sentiment score is attached to each conversation.

7. Live call handling

7.1 Your status

Status	Meaning
Available	Ready for routed calls; the session timer runs.
On call	Currently handling a conversation.
On break	Temporarily unavailable; excluded from routing.
Away	Signed in but not at the desk.
Offline	Not working. Timers stop and reset.

Signing out or closing the browser moves you to Offline automatically and clears the timer; signing back in starts a fresh session. Time in state is visible to supervisors.

7.2 Receiving a routed call

Smart routing scores agents on skills, language proficiency and recent performance. When you are chosen, the call panel opens with caller details, client history, suggested tags and one-click transfer.

7.3 Transfers and callbacks

Transfer lists only Available colleagues and attaches a handover summary generated from the live transcript. If the customer asks to be called back, use the Callback Scheduler; past dates roll forward to the next working day.

8. Appointments

Appointments booked by an agent or captured by the IVR keypad flow appear in Dashboard → Appointments. Confirmation emails are sent when the booking is saved, in the language the caller selected.

9. IVR and multilingual audio

- Setup → Voice & Languages → IVR Menu binds each keypad digit to an action: play a prompt, gather input, transfer to an agent, book an appointment or escalate.
- Languages defines what callers can be served in; Audio holds the per-language recordings.
- System Recordings holds shared prompts such as intros and closings.

10. Supervision and analytics

- Supervisor console: live agent states, queue depth, transfers and escalation alerts.
- Dashboard → Analytics: live volumes, outcomes and sentiment trends for the current day.
- Campaign Analytics: results by time range with drill-down to the clients contacted.
- Leaderboard: agent ranking by handled volume and outcomes.
- Knowledge base and AI policy notes: the approved answers agents should use on calls.

11. Administration

- People: invite agents, assign roles, and maintain skills used by routing.
- Telephony: caller ID and bridge settings live in Call Settings; carrier credentials live in SIP Trunks. Both must be correct before outbound campaigns will connect. Use Verify to test.
- Catalog: Product Types and Campaign Types. Deactivate retired entries instead of deleting them so history stays readable.
- Secrets: API keys are stored server-side and are never exposed to the browser.
- Active Directory: connect Entra ID, AD FS, Okta, OneLogin, Google Workspace or generic SAML 2.0 with a guided, self-verifying checklist.

12. Privacy and data protection

- Profile → Privacy exports every record tied to an account.
- Deletion requests anonymise personal identifiers while preserving aggregate call statistics.
- Recordings and transcripts are restricted to staff roles, enforced in the database.

13. Troubleshooting

Symptom	Likely cause	Fix
Browser call will not connect	Microphone blocked	Re-allow microphone in browser settings.
No calls routed to you	You are not Available	Set your status to Available in the header.
Invalid login credentials	Wrong email or password	Retry carefully, then reset the password.
Client will not save	Phone number cannot be normalised	Enter a valid local or +country number.
Product Type missing	Not in the catalogue	Add it in Setup → Catalog → Product Types.
Campaign not dialing	Outside the dialing window	Check campaign hours and timezone.
Timer keeps running	Status left on Available	Set Offline; closing the browser also clears it.

14. Glossary

Term	Meaning
ACW	After-call work: wrap-up time once a call ends.
DTMF	Touch-tone keypad input.
E.164	International phone format, e.g. +233246052499.
IVR	Interactive voice response menu.
RLS	Row-level security: per-row database access rules.
SSO	Single sign-on via your corporate directory.

15. Support

Use Officer Chat inside the app for day-to-day questions, and contact your administrator for account or escalation issues. Production URL: <https://elcareconnect.lovable.app>.
