

EL Calls

Complete User Manual — Operators, Agents, Supervisors and Administrators

Version 2.6 • June 2026

1. Introduction

EL Calls is an AI-assisted outbound calling platform that combines automated voice campaigns, live agent handling, real-time supervision, and analytics. The platform pairs the Twilio voice network with browser-based WebRTC calling, a multilingual IVR, and an officer chat assistant powered by Lovable AI.

This manual covers everything a non-technical user needs: signing in, navigating the workspace, running campaigns, managing agents and shifts, handling live calls, configuring escalations, scheduling appointments, reviewing analytics, and managing privacy/GDPR requests.

2. Getting Started

2.1 Accessing the platform

Open <https://elcalls.lovable.app> in Chrome, Edge or Safari. The app is a responsive single-page application that also works on tablets. Microphone permission is required for WebRTC calling and voice-to-text.

2.2 Signing in

From the landing page, click **Sign In**. Existing users enter their email and password. New agents receive an invitation email containing a one-time link that lands on a password-setup screen; the same screen is used for password reset.

2.3 First-run checklist for administrators

- Complete the **Setup** wizard (Twilio credentials, OpenAI key for AI features, business hours).
- Invite the first supervisor and a handful of agents from **Dashboard** → **Agents**.
- Upload your client list from **Clients** and tag them.
- Create a Campaign Type, then a Campaign that targets a tagged client group.
- Open **Escalation Settings** and add at least one notification recipient.
- Open the AI Policy Notes panel and paste your call scripts and compliance rules.
- Publish the app for production use.

3. Workspace Tour

The workspace uses a collapsible left sidebar (toggle with the chevron icon) and a top header containing the search palette, theme toggle, agent-status widget, and profile menu. Tabs scroll to the top automatically on every navigation.

3.1 Sidebar sections

Section	Audience	Purpose
Home	All	Marketing landing page and quick links.
Dashboard	Admin/Supervisor/Agent	Tabbed operational console (Calls, Campaigns, Clients, Appointments, Agents, etc.).
Campaign Analytics	Admin/Supervisor	Per-campaign progress, sentiment and recordings.
Supervisor	Supervisor/Admin	Live queues, transfers, escalations, real-time KPIs.
Miscellaneous	Admin	Grouped admin tools (SIP trunks, IVR, languages, recordings, secrets, roles).
Profile	All	Personal info, preferences (?tab=preferences), notifications.
Documentation	All	Embedded user and developer guides.

4. Roles and Permissions

Roles are enforced server-side via the *has_role()* security-definer function. Client-side menus simply hide what the role cannot access.

Role	Can do
Admin	Everything: settings, secrets, role assignment, all data.
Supervisor	Live monitoring, transfers, escalation handling, all campaigns, analytics.
Agent	Home + Dashboard (own calls, own appointments, own status).

5. Campaigns

5.1 Campaign types

Open **Dashboard** → **Campaign Types** to create a template (e.g. *Appointment Reminder*, *Payment Follow-up*). Each type holds the AI prompt, default IVR menu, retry policy, and language defaults.

5.2 Creating a campaign

- Go to **Dashboard** → **Campaigns** → **New Campaign**.
- Pick a campaign type, give it a name, and select target clients via tag, list upload, or filter.
- Set the dialing window (timezone-aware), max concurrent calls, and retry attempts.
- Optionally attach a translation override per supported language.
- Click **Start** to enqueue jobs; **Pause** and **Resume** are available at any time.

5.3 Monitoring progress

The **Campaign Progress** panel shows dialed, connected, answered-by-human, voicemail, failed, and pending counts in real time. Drill into any row to see the full call timeline, sentiment trend, recording, and transcript.

5.4 Recordings and transcripts

Recordings appear in **Campaign Recordings** within ~10 seconds of call completion. Transcripts are produced by OpenAI Whisper and indexed for full-text search.

5.5 SMS campaigns

From **Dashboard** → **SMS Campaigns**, create message templates, target a client tag, and schedule send windows. Delivery receipts feed the same analytics surface as voice campaigns.

6. Live Call Handling

6.1 Agent status

Use the header widget to switch between **Available**, **Busy**, **Away**, **Break – Lunch**, **Break – Personal**, and **Offline**. Status colour and a pulsing icon mirror your state. Presence auto-flips to *Away* after 5 minutes of inactivity; a 30-second heartbeat keeps you online while the tab is open.

6.2 Receiving a routed call

Smart routing scores agents by skills, language proficiency and recent performance. When you are picked, a WebRTC panel opens with caller details, client history, suggested tags and a one-click transfer button.

6.3 Live transcription and sentiment

Speech is transcribed every few seconds. A sentiment badge updates per turn so supervisors can spot a deteriorating tone before the customer asks for an escalation.

6.4 Transferring a call

Click **Transfer**, choose a target agent (only Available agents are listed), and confirm. A warm-handover summary is auto-generated from the live transcript and attached to the new call record.

6.5 Callbacks

If the customer asks for a callback, open **Callback Scheduler** from the call panel. Pick a date and time; past dates are auto-shifted to the next business day, and weekend slots roll forward to the next Monday.

7. Appointments

Appointments captured during a call (or via IVR) land in **Dashboard** → **Appointments** with a calendar view. Confirmation emails are sent through the appointment-scheduler function. The IVR collects appointment data via DTMF in the caller's chosen language, then finalises it before hanging up.

8. IVR and Multilingual Audio

8.1 IVR menus

Build menus from **Miscellaneous** → **IVR Menus**. Each option binds a DTMF digit to an action: play prompt, gather DTMF, transfer to agent, schedule appointment, or escalate. Press 0 anywhere to be routed to a live agent.

8.2 Supported languages

Add languages from **Miscellaneous** → **Languages**, upload greeting and prompt MP3s in the language audio uploader, and the IVR will offer them at runtime.

9. Escalations

Escalation rules live in **Dashboard** → **Escalation Settings**. Three tiers run every 30 seconds:

- **Warning** — wait time or sentiment cross a soft threshold.
- **Escalation** — supervisor is notified.
- **Critical** — emergency alert raised; configured recipients receive email/SMS via the send-escalation-notification function.

Recipients are stored server-side and are never accepted from the browser, preventing tampering.

10. Officer Chat

A floating chat panel on the far right runs the Officer Chat assistant (Lovable AI Gemini 2.5 Flash). Ask questions about policies, recent calls, or how to perform a workflow. The panel is non-modal so you can keep working while it answers.

11. Knowledge Base and AI Policy Notes

Curate compliance rules, scripts and FAQs in **Knowledge Base** and **AI Policy Notes**. The AI agent and Officer Chat ground their responses in these documents before answering.

12. Analytics

- **Realtime Analytics Dashboard** — KPIs that refresh every few seconds.
- **Call History Analytics** — answer rate, average handle time, conversion, sentiment by campaign.
- **Agent Leaderboard** — adherence, ACW, and quality scores.
- **Campaign Analytics** page — drilldowns per campaign run with sentiment trends.

13. Administration

13.1 Inviting agents

From **Dashboard** → **Agents** → **Invite**, enter the agent's email. The invitation function records the inviter on the server (you cannot impersonate another inviter from the browser) and sends the password-setup link.

13.2 Skills and shifts

Assign skills (product knowledge, languages) in **Agent Skills Manager**. Plan rotas in **Agent Shift Scheduler**; smart routing prefers agents on-shift with matching skills.

13.3 Roles

Manage admin/supervisor/agent assignments in **User Role Management**. Roles are stored in a dedicated *user_roles* table to prevent privilege-escalation.

13.4 Secrets

API keys for Twilio, OpenAI, SendGrid etc. live in **App Secrets** (admin only). They are stored server-side as Lovable Cloud secrets and never exposed to the browser.

13.5 Twilio diagnostics

Twilio Recent Calls and **Twilio Verify** help confirm connectivity. Both are restricted to staff and rate-limited.

14. Privacy and GDPR

Open **Privacy Panel** to export or delete a customer's data on request. Export bundles call records, transcripts, recordings, appointments and notes into a downloadable ZIP. Delete performs a cascading soft-delete and writes an audit-log entry.

15. Notifications

Desktop notifications can be enabled in Profile → Preferences. Email notifications use the configured SendGrid account. SMS notifications use the configured Twilio sender.

16. Mobile and Accessibility

The layout collapses on tablets and phones. All interactive controls have keyboard equivalents and ARIA labels. The Command Palette (Ctrl/Cmd+K) jumps to any tab or action.

17. Troubleshooting

Symptom	Likely cause	Fix
WebRTC call won't connect	Mic permission denied	Re-allow microphone in browser settings.
No incoming call routed	You are not Available	Set status to Available in header widget.
Invitation email not received	Wrong domain or spam	Check spam, verify SendGrid sender domain.
AI assistant errors	Lovable AI rate limit	Wait and retry; admin can review usage.
Campaign stuck	Outside dialing window	Check campaign hours and timezone.

18. Glossary

Term	Meaning
ACW	After-Call Work — wrap-up time after a call ends.
DTMF	Touch-tone keypad input.
IVR	Interactive Voice Response menu.
RLS	Row-Level Security in the database.
WebRTC	Browser-to-browser real-time audio.
ASR	Automatic Speech Recognition (Whisper).

19. Support

In-app: Officer Chat (right rail). For escalations contact your administrator. Production URL: <https://elcalls.lovable.app>.
